Study Methodology

This study, funded by Impact Genome with support from The MassMutual Foundation, was conducted by The Associated Press-NORC Center for Public Affairs Research. Data were collected using AmeriSpeak®, NORC's probability-based panel designed to be representative of the U.S. household population. During the initial recruitment phase of the panel, randomly selected U.S. households were sampled with a known, non-zero probability of selection from the NORC National Sample Frame and then contacted by U.S. mail, email, telephone, and field interviewers (face to face). The panel provides sample coverage of approximately 97% of the U.S. household population. Those excluded from the sample include people with P.O. Box only addresses, some addresses not listed in the USPS Delivery Sequence File, and some newly constructed dwellings. Staff from NORC at the University of Chicago, The Associated Press, and Impact Genome collaborated on all aspects of the study.

Interviews for this survey were conducted between March 25 and April 15, 2021, with adults age 18 and older representing the 50 states and the District of Columbia. Panel members were randomly drawn from AmeriSpeak, and 2,314 completed the survey—2,115 via the web and 199 via telephone. Interviews were conducted in both English and Spanish, depending on respondent preference. Respondents were offered a small monetary incentive (\$2) for completing the survey.

The final stage completion rate is 23.4%, the weighted household panel response rate is 19.5%, and the weighted household panel retention rate is 75%, for a cumulative response rate of 3.4%. The overall margin of sampling error is +/- 2.9 percentage points at the 95 percent confidence level including the design effect.

In addition, Black, Hispanic, respondents from households below 100% of the Federal Poverty Level (FPL) and respondents from households between 100%-200% FPL were sampled at a higher rate than their proportion of the population to support analyses.

Subgroup	Number of completed interviews	Margin of sampling error at the 95% confidence level including the design effect
Black Americans	633	+/- 6.3 percentage points
Hispanic Americans	624	+/- 6.3 percentage points
Respondents from households below the FPL	521	+/- 4.9 percentage points
Respondents from households between 100% and 200% FPL	749	+/- 6.2 percentage points

Once the sample has been selected and fielded, and all the study data have been collected and made final, a poststratification process is used to adjust for any survey nonresponse as well as any non-coverage or under and oversampling resulting from the study specific sample design. Poststratification variables included age, gender, census division, race/ethnicity, education, and FPL. Weighting variables were obtained from the 2020 Current Population Survey. The weighted data reflect the U.S. population of adults age 18 and over.
